# Malware Inc.

Infect All The Devices In The World

Overview:

This game is based on Plague Inc which allows the player to develop their own virus and to facilitate its spread across the world, but in this game the idea is to spread malware rather than a virus.

Objectives:

The aim of the game is to spread the malware worldwide and infect every device in the world. At the start, the devices you can infect will be limited by their operating systems and by purchasing upgrades you will have the ability to ultimately infect every device. You must however be quick in enhancing and spreading your malware as researchers will be working to eradicate it!

Core Features:

Upgrade your virus to increase it stat's (infection rate, income rate, and possible infectable devices) to make sure that it succeeds in it's task of infecting every device in the world.

Future Developments:

The hope is to introduce a more user-friendly interface that is similar to the Plague Inc. interface. At the moment the interface reflects core data in order to demonstrate that the game is functioning as it is meant to.

Platform/Release:

This will be released on both iOS and android mobile devices, which is because the majority of mobile devices use these operating systems.

Walkthrough/Documentation:

If you would like to look at a demonstration of this game running, you can scan the QR code below which will take you to a walkthrough of the game. Furthermore, if you would like to look at the documentation and the code, you can click on the github icon to take you to the repository.
